

Computer technology will allow us to conduct real-time communication with veterinarians across the nation through a dedicated website portal. These lines of communication are vital to help them understand and monitor the dynamic changes occurring in their patient's health from immunotherapy COLT treatment.

Furthermore, information technology plays a critical role in the across the board monitoring of CAVU Biotherapies' novel white blood cell re-programming platform developed specifically for COLT and the patient's sample tracking via QR codes through each step of the process.

Advanced computer technology will permit the communication between several mechanical systems to streamline manufacturing and optimization of COLT services and ISAV/IHAV, our immune-marker-based "big data" analysis platforms. By leveraging cloud services, we are going to jumpstart our IT firepower to shorten our time to market for web services already in development.

Powered by the on-demand scalability, accessibility, speed, and cost savings of the cloud, we anticipate rolling out, ISAV/IHAV to provide our dogs with maximal health benefits and allow veterinarians to start practicing revolutionary proactive medicine. It is time to start thinking "outside the crate"!
